Transthoracic echocardiogram report

Study Transthoracic echocardiogram
Date of study 10 February 2026
Date reported 13 February 2026
Requested by Dr Helena Vasquez-Okafor, Consultant Cardiologist
Indication Breathlessness on exertion and ankle swelling; query heart failure
Study quality Adequate

Measurements

Measurement	Result	Units	Reference range
Left ventricular ejection fraction (Simpson's biplane)	38	%	> 55
Left ventricular internal diameter, diastole	58	mm	-
Mitral valve	Mild regurgitation	-	-
Aortic valve	Trileaflet, no stenosis	-	-

Measurements as acquired at the study on 10 February 2026.

Findings

Left ventricle: the left ventricle is mildly dilated, with an internal diameter in diastole of 58 mm. Systolic function is moderately impaired. The ejection fraction measured by Simpson's biplane method is 38%, against a normal value of greater than 55%.

Mitral valve: there is mild mitral regurgitation demonstrated on colour Doppler. This is not of haemodynamic significance and does not require surveillance in its own right.

Aortic valve: trileaflet aortic valve with no stenosis.

Conclusion

Moderate left ventricular systolic dysfunction. Mild mitral regurgitation. Trileaflet aortic valve with no stenosis.

The findings have been discussed with the requesting consultant. A copy of this report has been sent to the patient's general practitioner and, at his request, to the patient at his home address.
